## Question 1 -- Astable Multivibrator

The circuit above has been simulated using PSpice. Using PROBE, the voltages at pins $2,6,7$, and 3 have been displayed.
a. Label which trace goes with which pin $(2,3,6,7)$ in each time period. Be sure that you label the traces in both the on and off parts of the pulse cycle. (8 points)

b. What is the duty cycle of the pulses in the plot? (4 points)

$$
T 1=0.96 s \quad T 2=0.60 \mathrm{~s} \quad T=1.56 s
$$

$$
\text { duty cycle }=T 1 / T=.615 \quad \text { duty cycle }=61.5 \% \text { (answers may vary) }
$$

## ENGR4300 Test 3A and 3B Fall 2003

## Section

b. Determine the values of R1 and R2 from the information in this plot. (4 points)
$T 2=0.693(R 2)(C 1) \quad 0.6=0.693(R 2)(10 E E-6) R 2=0.0866 E E 6$ R2 $=86.6 \mathrm{~K}$ ohms
$T 1=0.693(R 1+R 2)(C 1) 0.96=0.693(R 1+86.6 K)(10 E E-6) R 1+86.6 K=138.5 K$

## R1=51.9K ohms

c. Test A:What could you do to increase the duty cycle of the pulses? (4 points)
c. Test B:What could you do to decrease the duty cycle of the pulses? (4 points)
duty cycle $=T 1 / T=[0.693(R 1+R 2) C 1]=[0.693(R 1+2 R 2) C 1]=[R 1+R 2] /[R 1+2 R 2]$
duty cycle $=\frac{\frac{R 1}{R 2}+1}{\frac{R 1}{R 2}+2} \quad$ If $R 1 \gg R 2$ then the duty cycle approaches $100 \%-$ - It
increases. If $R 1 \ll R 2$ then the duty cycle approaches $50 \%$-- It decreases. Changing the value of the capacitor will influence the frequency, but not the duty cycle.

Test A: increase R1 or decrease R2
Test B: increase R2 or decrease R1

## Question 2 - Measuring Inductance (20 points)

This page is Test A: Given the following circuit and its AC sweep below:

a) Find the transfer function, $\mathrm{H}(\mathrm{j} \omega)$, at point B . Determine the function and the magnitude and the phase at high and low frequencies. (8 points)

$$
(2 \mathrm{pts}) \mathrm{H}(\mathrm{j} \omega)=
$$

method 1: excluding R2 $H(j \omega)=[R 1+j \omega L 1] /[R 1+j \omega L 1+1 / j \omega C 1]$ $H(j \omega)=\left[j \omega R 1 C 1-\omega^{2} L 1 C 1\right] /\left[j \omega R 1 C 1--\omega^{2} L 1 C 1+1\right]$
method 2: including R2

$$
H(j \omega)=[R 1+j \omega L 1] /[R 2+R 1+j \omega L 1+1 / j \omega C 1]
$$

$H(j \omega)=\left[j \omega R 1 C 1-\omega^{2} L 1 C 1\right] /\left[j \omega(R 1+R 2) C 1--\omega^{2} L 1 C 1+1\right]$ either is ok
$(1 \mathrm{pt}) \mathrm{H}\left(\mathrm{j} \omega_{\mathrm{lo}}\right)=j \omega \boldsymbol{R} \boldsymbol{C l} \boldsymbol{I}$
$(1 \mathrm{pt}) \mathrm{H}\left(\mathrm{j} \omega_{\mathrm{hi}}\right)=\mathbf{1}$
$(1 \mathrm{pt})\left|\mathrm{H}\left(\mathrm{j} \omega_{\mathrm{lo}}\right)\right|=\mathbf{0}$
$(1 \mathrm{pt})\left|\mathrm{H}\left(\mathrm{j} \omega_{\mathrm{hi}}\right)\right|=\mathbf{1}$
(1 pt) $\angle \mathrm{H}\left(\mathrm{j} \omega_{\mathrm{lo}}\right)=\pi / 2$
$(1 \mathrm{pt}) \angle \mathrm{H}\left(\mathrm{j} \omega_{\mathrm{hi}}\right)=\mathbf{0}$

Fall 2003

Name solution
Section
b) Based on your results from part a), indicate on the plot the trace for the magnitude of the voltage at point B ( 2 points).
c) Find the resonant frequency $f_{0}$ from the plot. Notice that the $x$-axis has logarithmic scale. (ie. $10^{0.5}=3.16$ ) ( 3 points)

Test A: $f_{0}=10 E E(5.7)=501,187 \boldsymbol{f}_{0}=500 \mathrm{~K} \mathrm{~Hz}$ (answers may vary)
Test B: $f_{0}=10 E E(5.4)=251,189 \boldsymbol{f}_{0}=250 \mathrm{~K} \mathrm{~Hz}$ (answers may vary)
d) Solve for the unknown inductance. (5 points)

$$
\begin{aligned}
& \text { Test A: } f_{0}=1 /[2 \pi \operatorname{sqrt}(L 1 C 1)] L 1=1 /\left[C 1\left(2 \pi f_{0}\right)^{2}\right] \\
& L 1=1 /(0.01 E E-6)(\pi E E+6)^{2}=1 /[0.0987 E E+6]=10.1 E E-6 \\
& \boldsymbol{L 1}=\mathbf{1 0} \boldsymbol{u F} \quad(\text { answers may vary }) \\
&\text { Test B: } \left.f_{0}=1 / 2 \pi \text { sqrt }(L 1 C 1) L 1=1 / C 1\left(2 \pi f_{0}\right)^{2}\right] \\
& L 1=1 /(0.022 E E-6)(5 \pi E E+5)^{2}=1 /[5.43 E E+4]=0.18 E E-4 \\
& \boldsymbol{L 1}=\mathbf{1 8} \boldsymbol{u F} \quad(\text { answers may vary })
\end{aligned}
$$

e) Both of the resistances in this circuit are not physical resistors. They represent the resistance of something else in the circuit. Assuming that these do not represent wire resistance, what do they represent? (2 points)

The resistor $R 2$ is the $\mathbf{5 0}$ ohm impedance of the function generator. The resistor $R 1$ is the resistance in the wire of the inductor, $L 1$.

## Question 3 -- Op Amp Differentiator (20 points)

Test A: Given: $\mathbf{C} 1=0.001 \mu \mathrm{~F}$ R2 $=500 \Omega$
Test B: Given: $\mathbf{C 1}=\mathbf{0 . 0 0 2 2} \mu \mathrm{F}$ R2 $=1000 \Omega$
In this question, we will look at the effect of the 50 ohm input resistance on the opamp differentiator.
a) What is the expression for Vout/Vin for circuit A above. Give this in terms of C1, $\mathrm{R} 2, \mathrm{j}$ and $\omega$. (3 points)

$$
\frac{V_{\text {out }}}{V_{\text {in }}}=-j \omega R 2 C 1
$$

b) Determine the expression for Vout/Vin for circuit B above. (Be sure to include the impedance of the function generator, R1.) Give this in terms of $\mathrm{C} 1, \mathrm{R} 1, \mathrm{R} 2, \mathrm{j}$ and $\omega$. (3 points)

$$
\frac{V_{\text {out }}}{V_{\text {in }}}=\frac{-j \omega R 2 C 1}{1+j \omega R 1 C 1}
$$

c) Find the corner frequency $f_{c}$ for circuit $B$. This should be a numerical value in Hertz. (4 points)

Test A: $f_{c}=1 /[2 \pi R 1 C 1]=1 /[2 \pi(50)(0.001 E E-6)]=3.183 E E+6$

$$
f_{c}=3,183 \mathrm{~K} \mathrm{~Hz}=3.2 \mathrm{Meg} \mathrm{~Hz}
$$

Test B: $f_{c}=1 /[2 \pi R 1 C 1]=1 /[2 \pi(50)(0.0022 E E-6)]=1.447 E E+6$
$f_{c}=1,447 \mathrm{~K} \mathrm{~Hz}=1.4 \mathrm{Meg} \mathrm{Hz}$

## ENGR4300 Test 3A and 3B <br> Fall 2003

## Name solution

Section
d) Does circuit B behave like circuit A above or below the corner frequency? Use limits to show how you know this. (6 points)
$\frac{V_{\text {out }}}{V_{\text {in }}}=\frac{-j \omega R 2 C 1}{1+j \omega R 1 C 1}$
at low frequencies: $\frac{V_{\text {out }}}{V_{\text {in }}}=\frac{-j \omega R 2 C 1}{1}=-j \omega R 2 C 1 \quad$ differentiator $($ like $A)$
at high frequencies: $\frac{V_{\text {out }}}{V_{\text {in }}}=\frac{-j \omega R 2 C 1}{j \omega R 1 C 1}=\frac{-R 2}{R 1} \quad$ (inverting amplifier)

Circuit B will behave like circuit A below the corner frequency.
e) At about what frequencies does the 50 ohm impedance of the function generator prevent this circuit from differentiating? (4 points)

Circuit B should act like a differentiator at frequencies much less than $f_{c}$. Therefore, it will not differentiate above $f_{c}$. Minimally we could say that the resistance prevents this circuit from working at frequencies above about 3 Meg Hz for Test A and 1.5 Meg Hz for Test B. Even better, we could estimate that it would not be differentiating even above frequencies a bit lower, perhaps 1Meg Hz for Test A and 1.5Meg Hz for Test B. For a conservative estimate, we have plenty of frequency range available to go down an entire decade. Therefore, I would say conservatively,

Test A: 300 K Hz and above
Test B: 150 K Hz and above
(answers may vary)

# ENGR4300 Test 3A and 3B <br> Fall 2003 

## Question 4 - Zener Diodes (20 points)

The circuit above is a zener diode voltage regulator. Assume the zener voltage of the diode is 4.7 volts and its forward bias voltage is 0.7 volts.

1) What does a voltage regulator do? (2 points)

A voltage regulator is a circuit which prevents the voltage from exceeding a set voltage limit.
(In this case, the positive limit is +4.7 V and the negative limit is -0.7 V .)
2) What would the voltage at V 2 be when $\mathrm{V} 1=6 \mathrm{~V}$ if R 2 has the following values: (6 points)
i) 1 K ohms expected voltage $V 2=(1 \mathrm{~K} / 11 \mathrm{~K}) 6 \mathrm{~V}=0.54 \mathrm{~V}(0.54<4.7)$
$V 2=0.54 \mathrm{~V}$
ii) 10 K ohms expected voltage $V 2=(10 \mathrm{~K} / 20 \mathrm{~K}) 6 \mathrm{~V}=3 \mathrm{~V} \quad(3<4.7)$

$$
V 2=3 V
$$

iii) 100 K ohms expected voltage $V 2=(100 \mathrm{~K} / 110 \mathrm{~K}) 6 \mathrm{~V}=5.45 \mathrm{~V}(5.45>4.7)$

$$
V 2=4.7 V
$$

3) What would the voltage at V 2 be when $\mathrm{V} 1=-6 \mathrm{~V}$ and if R 2 has the following values: (6 points)
i) 1 K ohms expected voltage $V 2=(1 K / 11 \mathrm{~K})-6 V=-0.54 \mathrm{~V}(-0.54>-0.7)$
$\boldsymbol{V} \mathbf{2}=\mathbf{- 0 . 5 4 V}$
ii) 10 K ohms expected voltage $V 2=(10 K / 20 K)-6 V=-3 V \quad(-3<-0.7)$

$$
V 2=-0.7 V
$$

iii) 100 K ohms expected voltage $V 2=(100 \mathrm{~K} / 110 \mathrm{~K})-6 \mathrm{~V}=-5.45 \mathrm{~V}(-5.54<-0.7)$

$$
V 2=-0.7 V
$$

## Section

$\qquad$
3) Each of the following three plots was made with a different value for R 2 : 1 K ohms, 10 K ohms and 100 K ohms. Indicate which plot was made with which value for R2. (6 points)

The plot below cuts off at 4.7 and -0.7 --> R2 $=100 \mathrm{~K}$

The plot below doesn't cut off at all --> R2=1K

The plot below cuts off at -0.7 , but not at $+4.7-->R 2=10 \mathrm{~K}$

## Question 5 -- Circuit functionality and transformers (20 points)

The following circuit was constructed to test two DC power supplies. One is a battery and one is a wall wart (connects to a normal 120 V outlet). The boxes surrounding each part of the circuit identify the functional blocks (each has a specific purpose). Each of the boxes is also shown expanded for clarity.

# ENGR4300 Test 3A and 3B 

Fall 2003
Name solution
Section $\qquad$

a. Identify the function of each of the nine blocks. (Draw a line to connect the letter of the block to its function). (9 points)

b. On the next page are plotted six voltages measured at various points in the circuit. Identify each of the voltages by indicating the block for which this is the output voltage. Note that there are only six voltages but there are eight output points for the blocks. (6 points)
c. Based on the voltages you have just identified, what is the ratio of the input voltage to the output voltage of the transformer? Note that a real transformer is modeled here so that it has finite resistance in its windings. However, you can neglect these small resistances in the rest of this problem. (3 points)

$$
120 \mathrm{~V}: 12 \mathrm{~V}=10: 1
$$

d. If the primary winding of the transformer has 10000 turns, how many turns does the secondary winding have to produce this change in voltage? ( 2 points)

Test A: N2/10000 = 1/10 N2 = 1000 turns
Test B: N2/20000 $=1 / 10 \quad$ N2 2000 turns
