

Quiz 3

MAGNETIC FIELDS & UNIFORM PLANE WAVES

Name _____

Section _____

Multiple Choice

1. (8 Pts) _____

2. (8 Pts) _____

3. (8 Pts) _____

4. (8 Pts) _____

5. (8 Pts) _____

Regular Questions

6. (20 Pts) _____

7. (20 Pts) _____

8. (20 Pts) _____

Total (100 Pts) _____**Notes:**

1. In the multiple choice questions, each question may have more than one correct answer; circle all of them.
2. For multiple choice questions, you may add some comments to justify your answer.
3. Make sure your calculator is set to perform trigonometric functions in radians & not degrees.

Some Comments and Helpful Info:

In this test, we use two types of notation for unit vectors. Keep in mind that

$$\hat{a}_x = \hat{x} \quad \hat{a}_y = \hat{y} \quad \hat{a}_z = \hat{z} \quad \hat{a}_r = \hat{r} \quad \hat{a}_\phi = \hat{\phi} \quad \hat{a}_\theta = \hat{\theta}$$

Be sure to show your work for the multiple choice questions.

Draw pictures for each problem to be sure that you understand the problem statement.

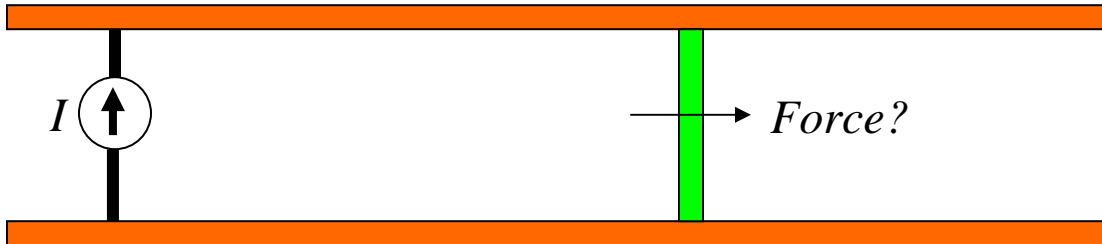

Quiz 3

MULTIPLE CHOICE QUESTIONS

Except for problem 4, there is only one answer to any of these questions.

1. Force (8 points)

A rectangular current loop is formed using two parallel conducting rails, a current source with a time-invariant current I , and a sliding contact between the rails. The force on the sliding contact will be directed to the right for which of the following cases?

- when the current is as shown but not when the current is in the opposite (downward) direction.
- not when the current is as shown but when the current is in the opposite (downward) direction.
- when the current is as shown and when the current is in the opposite (downward) direction..
- never, there is no force on the sliding contact.

2. Shielding (8 points)

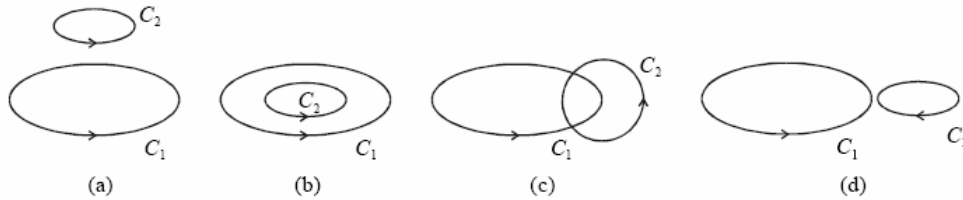

In order to prevent the electric and magnetic fields from entering or leaving a room, the walls of the room are shielded with 1-mm thick aluminum foil. The best protection is achieved at

- 1 Hz
- 1 kHz
- 1 MHz
- 1 GHz
- No difference

Quiz 3

3. Mutual Inductance (8 Points)

Of the four mutual positions of the two loops shown, the magnitude of the mutual inductance between the loops is largest for the position in

- i. Figure (a)
- ii. Figure (c)
- iii. Figure (d)
- iv. Figure (b)
- v. Cannot tell

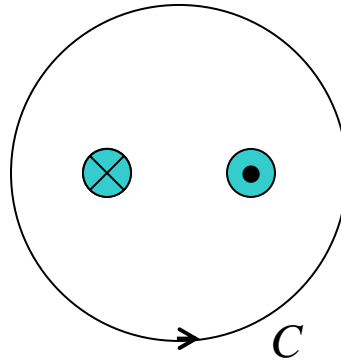

4. Fields and Waves Heroes (8 Points)

Identify which name goes with each equation. Equation (c) does not have a name and one name goes with all of the equations.

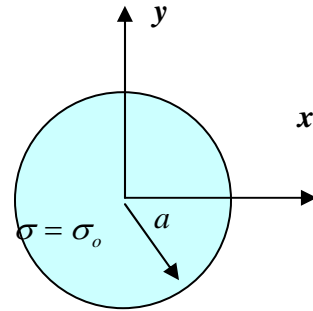

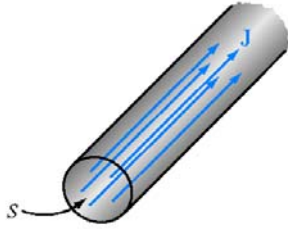

- | | |
|--|---------|
| a) $\oint \vec{E} \cdot d\vec{l} = -\frac{d}{dt} \int \vec{B} \cdot d\vec{S}$ | Maxwell |
| b) $\oint \vec{H} \cdot d\vec{l} = \int \vec{J} \cdot d\vec{S} + \frac{d}{dt} \int \vec{D} \cdot d\vec{S}$ | Faraday |
| c) $\oint \vec{B} \cdot d\vec{S} = 0$ | Gauss |
| d) $\oint \vec{D} \cdot d\vec{S} = \int \rho_v dv$ | Ampere |

5. Ampere's Law (8 points)

Two **cylindrical** conductors of a circular cross section (radius = a) carry a time-invariant current I ($I > 0$) directed **into the page** at the left **out of the page** at the right. The line integral of the magnetic flux density vector, \vec{B} , along a closed circular contour C positioned as shown is

- a) $\mu_0 I$
- b) $-\mu_0 I$
- c) greater than $\mu_0 I$
- d) less than $-\mu_0 I$
- e) less than $\mu_0 I$ and positive
- f) greater than $-\mu_0 I$ and negative
- g) zero

REGULAR QUESTIONS**6. Ampere's Law (20 points)**

A long, straight, solid cylindrical conductor with a radius of a is shown above. The surrounding medium is free space. There is a total current I_o carried by this conductor directed **into the page**.

- a. What is the current density vector? (5)

- b. What is the magnetic field intensity vector \vec{H} inside the conductor ($r < a$)? (5)

- c. How much energy is stored per unit length in the magnetic field of the region inside the conductor ($r < a$)? (5)

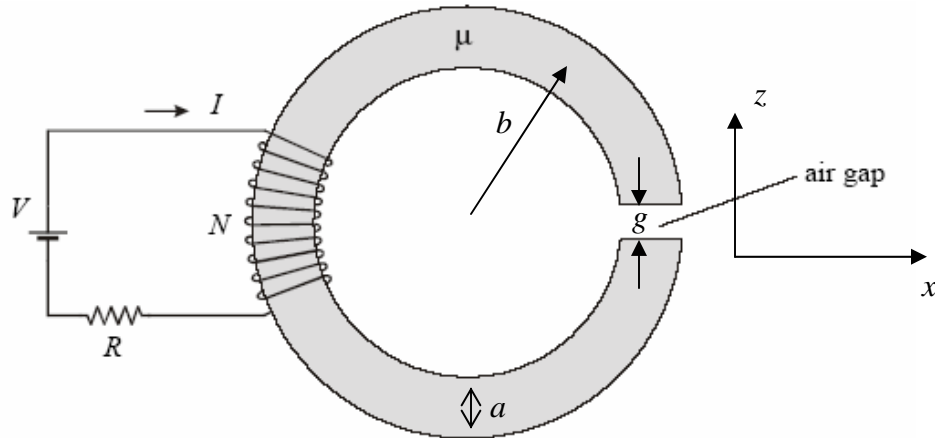

- d. What is the internal inductance of the conductor? That is, what is the inductance associated with the region inside the conductor ($r < a$)? (5)

Quiz 3

7. Magnetic Circuit and Faraday's Law (20 Points)

A thin toroidal core, made of a ferromagnetic material of permeability μ , has an air gap, as shown in the figure. There is a time-invariant current through the winding. The current-carrying wires are perfect conductors. The depth of the core is w .

a. Which of the following is correct for the magnitude of the magnetic field H_g in the gap? (6)

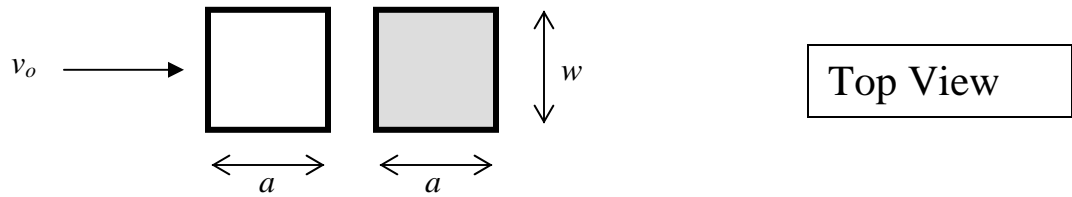

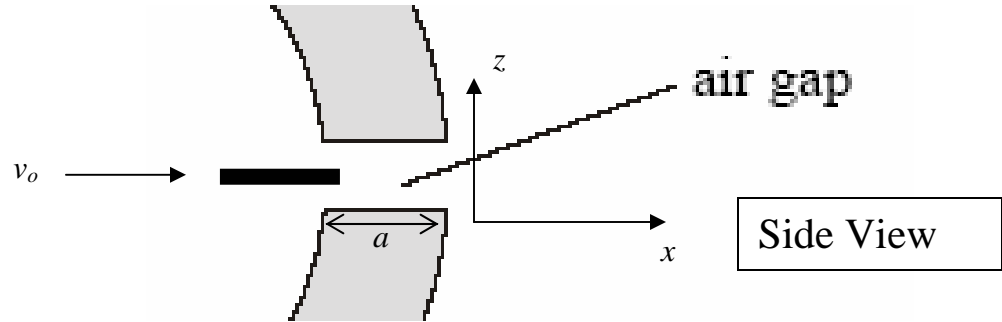

- $H_g = H_c$
- $H_g = 0$
- $H_g = \mu_0 H_c$
- $H_g = \frac{\mu_0}{\mu} H_c$
- $H_g = \frac{\mu}{\mu_0} H_c$

b. Now determine the magnetic field in the gap in terms of V , R , a , b , g , w and μ . Any reasonable approximation will be accepted. (8)

Quiz 3

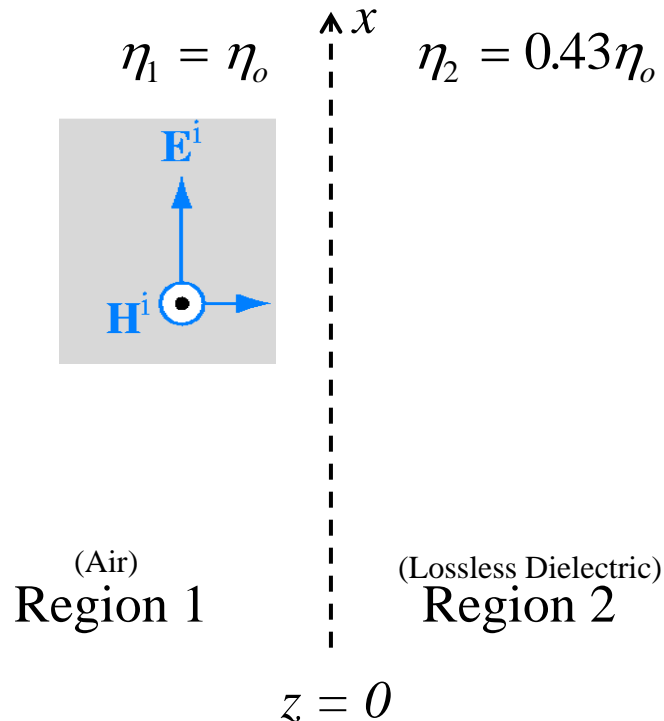

c. Now assume that a one turn square conducting loop passes through the gap as shown at a velocity v_o . Determine the voltage induced around the loop as a function of time. Note that the area of the loop is exactly equal to the area of the gap (a times w). (6)

Quiz 3

8. Uniform Plane Waves in Lossless and Materials (20 Points)

A uniform plane wave is propagating in air and incident normally on a lossless dielectric medium. The frequency of the wave is 300MHz. The average power density of the wave is 53 Watts per square meter. You might find it helpful to draw the vector diagram for each wave to be sure you have the directions correct. You do not have to simplify any expression (you can leave it in terms of parameters), except for part f, which requires a number.

a. Determine the angular frequency ω , the propagation constant β and the wavelength λ for this wave. (3)

b. Determine the magnitude of the electric field and both the electric and magnetic fields in phasor vector notation. (4)

c. Find the reflection coefficient Γ for the electric field. (3)

d. Write the phasor vector form of the reflected and transmitted electric fields. (4)

e. Find the phasor vector form of the transmitted wave magnetic field. (2)

f. Find the transmitted power. (4) (Be sure you provide a number for this part.)
